

### **3. Position: Mobile Application Developer. (2)**

A mobile app developer uses programming languages and development skills to create, test, and develop applications on mobile devices. They work in popular operating system environments like iOS and Android and often take into account UI and UX principles when creating applications.

#### **Mobile Application Developer Responsibilities**

- Identify opportunities to develop new mobile products and protocols
- Develop APIs to support functionality of mobile devices
- Work closely with colleagues in marketing and product development to improve app design and functionality
- Implement testing procedures to identify bugs
- Engage with users to better understand customer needs and opportunities for improvements
- Adapt current web applications for mobile platforms

#### **Job Requirements**

- A bachelor's degree in computer science or information systems.
- Minimum 3 years of experience with system design, programming, and data structuring
- Proficient knowledge of relevant computer languages for Android, iOS, and Windows devices.
- A portfolio of applications you have created or contributed to.
- Ability to multitask.
- Excellent interpersonal skills.

#### **Salary**

One of the biggest factors that can influence your salary is your level of experience. In general, the more years you spend working as a data analyst, the more you can expect to earn.
